—ABSTRACT—

Only a small number of ingested foreign bodies perforate the food passage and even a smaller fraction migrate extraluminally. Migrated foreign bodies have the potential to cause morbidity and mortality. This report describes a 59-year-old female patient who developed neck abscess due to perforation and extraluminal migration of a hypopharyngeal metallic foreign body. The abscess was successfully removed by CT guided aspiration and the patient was discharged without any specific complication. (J Clinical Otolaryngol 2002;13:234-237)

KEY WORDS : Migration · Hypopharyngeal metallic foreign body · CT guided aspiration

Fig. 1. Lateral view neck shows metallic foreign body.

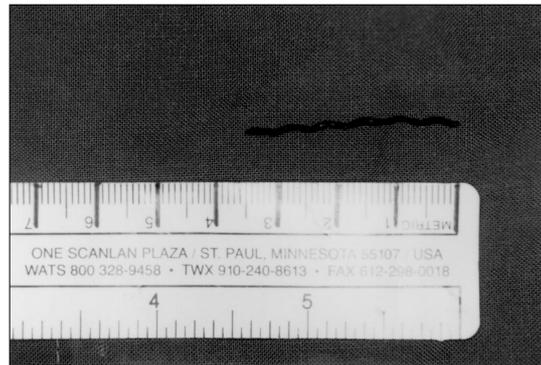

Fig. 2. Sharp metallic foreign body(size 35 mm).

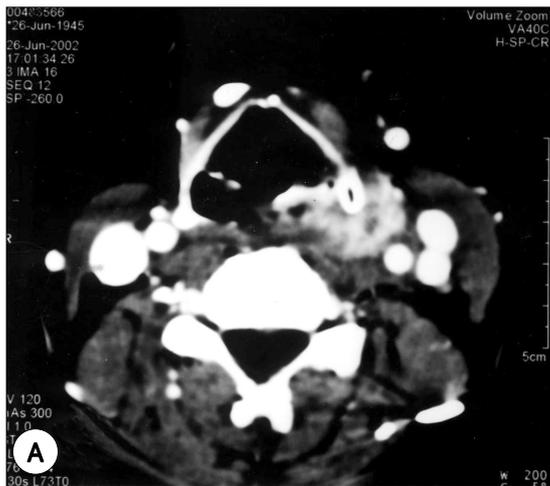

Fig. 3. A : CT scan shows inflammatory mass is around left pyriform sinus and retropharyngeal space. B : CT(inferior scan to A) scan shows abscess cavity with irregular marginated wall in retropharyngeal space.

Fig. 4. CT scan after CT gruided aspiration shows abscess cavity is not seen but soft tissue swelling.
